

• • • • • :

$$\frac{1}{v_p^2(\mathbf{x})} \frac{\partial^2 p(\mathbf{x}, t)}{\partial t^2} - \nabla^2 p(\mathbf{x}, t) = f(\mathbf{x}, t)$$

, :

It can be written compactly in operator form using the d'Alembert operator

:

$$\mathcal{L}_{\sqrt{}} = \{$$

where

$$\mathcal{L} \equiv \frac{1}{v_p^2} \frac{\partial^2}{\partial t^2} - \nabla^2$$

Alternative using ∇^2 from *physicspackage* $\frac{1}{v_p^2} \frac{\partial^2 p}{\partial t^2} - \nabla^2 p = f$
